

UNIT-2

Application Layer

Outline

- Principles of Computer Applications
- Web
- HTTP
- E-mail
- DNS
- Socket programming with TCP and UDP

Network Applications

Network Applications

- ▶ A Network application is an application **running on one host** and provides a **communication** to another application **running on a different host**.
- ▶ A network application development is writing **programs** that **run** on different end systems and **communicate** with each other over the network.
- ▶ In the Web application there are two different programs that communicate with each other:
 - **Browser** program running in the **user's** host.
 - **Web server** program running in the **Web server** host.

Network Applications - Examples

- ▶ Email
- ▶ Web
- ▶ Remote Login
- ▶ P2P File Sharing
- ▶ Multi-user Network Games
- ▶ Streaming Stored Video (YouTube)
- ▶ Voice Over IP (Skype)
- ▶ Real-time Video Conference
- ▶ Social Networking

Network Application Architecture

- ▶ Client-Server architecture
- ▶ P2P (Peer to Peer) architecture

Client-Server Architecture

► Server:

- Its **always-on** host.
- It has a **fixed** IP address.
- Large cluster of host – Data Centers.
- E.g. Web Server

► Client:

- It communicate with server.
- Its not like continuously connected.
- May have **dynamic** IP addresses.
- Do not communicate directly with each other.
- E.g. PCs, Mobiles

2. P2P Architecture

- ▶ Peers (end systems) **directly** communicate.
- ▶ Get peers request service from other peers, provide service to other peers.
 - ↳ **Self Scalability** – New peers bring new service capacity, as well as new service demands.
- ▶ Peers are alternatingly connected and change IP addresses.
 - ↳ Complex management

Process Communicating

▶ What is Process?

→ A process is an **instance of a program** running in a computer.

▶ We can say that process is program under execution.

▶ Within same host, two processes communicate using **inter-process communication (IPC)**.

▶ Process in different hosts communicate by exchanging messages.

▶ **Client process**: A process that initiates communication.

▶ **Server process**: A process that waits to be contacted.

```
File Edit Search Run Compile Debug Project Options Window Help
FIRST.C
#include <stdio.h>
#include <unistd.h>
void main()
{
    clrscr();
    printf("Hello World.. ");
    getch();
}
```

Socket

- ▶ A process sends messages into and receives messages from; the network through a software interface called a **socket**.
- ▶ A process is like a **house** and its socket is like its **door**.
 - ➔ Sending process passes message outdoor.
 - ➔ Sending process relies on transport infrastructure on other side of door to deliver message to socket at receiving process.

The diagram illustrates the socket communication model using a house analogy. On the left, a house represents the 'Process'. Inside the house, there are four layers: 'application', 'process' (highlighted in a blue oval), 'transport', and 'network'. A yellow box labeled 'socket' is located at the 'process' layer. A callout box labeled 'Process' points to the house. A callout box labeled 'Socket' points to the yellow box. A red arrow labeled 'socket' points from the yellow box to the right. In the center, a blue wavy shape represents the 'Internet'. A red arrow points from the 'Internet' to the right. On the right, another house represents the 'Process'. Inside this house, there are four layers: 'application', 'process' (highlighted in a blue oval), 'transport', and 'network'. A yellow box labeled 'socket' is located at the 'process' layer. A callout box labeled 'socket' points to the yellow box. A red arrow labeled 'controlled by app developer' points to the 'application' layer. A red arrow labeled 'controlled by OS' points to the 'transport' layer. A computer monitor is shown next to the house. A red arrow points from the 'Internet' to the yellow box.

- # Socket
- ▶ A process sends messages into and receives messages from; the network through a software interface called a **socket**.
 - ▶ A process is like a **house** and its socket is like its **door**.
 - ➔ Sending process passes message outdoor.
 - ➔ Sending process relies on transport infrastructure on other side of door to deliver message to socket at receiving process.
-
- The diagram illustrates the socket communication model using a house analogy. On the left, a house represents the 'Process'. Inside the house, there are four layers: 'application process' (top), 'transport' (yellow box), 'network link', and 'physical' (bottom). A callout box labeled 'Process' points to the 'application process' layer. A yellow box in the 'transport' layer is labeled 'socket'. A callout box labeled 'Socket' points to this yellow box. A red arrow points from the 'socket' box to the 'Internet' cloud. On the right, another house represents the receiving process. It has the same four layers: 'application process', 'transport', 'network link', and 'physical'. A callout box labeled 'socket' points to the yellow box in the 'transport' layer. A red arrow points from the 'Internet' cloud to this 'socket' box. A red arrow points from the 'application process' layer to the text 'controlled by app developer'. A red arrow points from the 'transport' layer to the text 'controlled by OS'. A computer monitor is shown next to the right house. A person is running with a package towards the 'Internet' cloud.

Transport Services to Applications

- ▶ Recall that a socket is the **interface** between the application process and the transport layer protocol.
- ▶ For develop an application, choose available transport layer protocol.
- ▶ Pick the protocol with the services that best match the needs of your application.
- ▶ Example: Choose either Train or Airplane transport for travel between two cities.
- ▶ Classify services with four parameters:

Reliable Data
Transfer

Throughput

Timing

Security

Transport Services to Applications

► Reliable Data Transfer:

- ➔ Many applications (e.g., email, file transfer, financial applications) require 100% reliable data transfer
- ➔ Required guarantee that data sent by one end of application is delivered correctly and completely to the other end of application.
- ➔ This guaranteed data delivery service is called **Reliable Data Transfer**.
- ➔ When it will fail to deliver reliable data transfer, it is acceptable for **loss-tolerant** applications.
- ➔ Loss-tolerant Applications (e.g., audio/video) can tolerate some loss.

Transport Services to Applications

► Throughput

- Some apps (e.g., multimedia) require at least amount of throughput to be “effective”
- Bandwidth sensitive application, specific throughput required.
- Elastic application can use of as much, or as little, throughput as happens to be available.

► Timing

- some apps (e.g., Internet telephony, interactive games) require low delay to be “effective”

► Security

- In the sending host, encrypt all data transmitted by the sending process.
- In the receiving host, decrypt the data before delivering the data to the receiving process.

Internet Transport Protocols Services

► TCP Service:

- **Connection-Oriented:** A setup required between client and server processes
- **Reliable data transfer** between sending and receiving process without error and proper order
- **Congestion control:** To control sender when network overloaded
- It does not provide, Timing, at least throughput guarantee (not preferred in real-time application)

► UDP Services:

- **Connectionless:** No connection before two processes start to communicate.
- **Unreliable data transfer** between sending and receiving process
- It does not provide **congestion control**.
- It Does not provide. **Reliability**, flow control, throughput guarantee, security.

Internet Applications

- Popular internet applications with their application layer and their underlying transport protocol.

Applications	Application-Layer Protocol	Underlying Transport Protocol (Service)
Email	SMTP	TCP
Remote Terminal	Telnet	TCP
Web	HTTP	TCP
File Transfer	FTP	TCP
Streaming Media	HTTP(YouTube), RTP	TCP or UDP
Internet Telephony	SIP, RTP(Skype)	Typically UDP

Loss-tolerant

**No loss,
Elastic
Bandwidth**

Web & HTTP

Web

- ▶ Early 1990, Internet was used only by **researchers, academics**, and **university students**.
- ▶ New application **WWW** arrived in 1994 by **Tim Berners-Lee**.
- ▶ **World Wide Web** - is an information where documents and other web resources are identified by **URL**, interlinked by hypertext links, and can be accessed via the Internet.
- ▶ **On demand** available, What they want, When they want it.
- ▶ Unlike **TV and Radio**.
- ▶ Navigate through **Websites**.

Web and HTTP

- ▶ Web page consists of **objects**.
- ▶ Object can be HTML file, JPEG image, Java applet, audio file etc....
- ▶ Web page consists of base HTML-file which includes several referenced objects.

Web Page (e.g Total five objects)

- ▶ Each object is addressable by a **Uniform Resource Locator** (URL), like;

`www.someschool.edu/someDept/pic.gif`

host name

path name

HTTP

- ▶ HyperText Transfer Protocol – **Application layer protocol**
- ▶ It is implemented in **two** programs.
 - ➔ Client Program
 - ➔ Server Program
- ▶ Exchanging HTTP message each others.
- ▶ HTTP defines the structure of these messages and how web client – web server exchange messages.

HTTP – Cont...

► HTTP

- ➔ Hyper-Text Transfer Protocol
- ➔ It is Application layer protocol
- ➔ Client: A browser that requests, receives, (using HTTP protocol) and “displays” Web objects.
- ➔ E.g. PC, Mobile
- ➔ Server: Web server sends (using HTTP protocol) objects in response to requests.
- ➔ E.g. Apache Web Server

HTTP - Cont...

- ▶ A client initiates **TCP connection (creates socket)** to server using port **80**.
- ▶ A server accepts TCP connection from client.
- ▶ HTTP messages (application-layer protocol messages) exchanged between browser (HTTP client) and Web server (HTTP server).
- ▶ HTTP is “**stateless protocol**”, server maintains no information about past client requests.
- ▶ HTTP connection types are:
 - Non-persistent HTTP
 - Persistent HTTP

Non-persistent HTTP & Persistent HTTP Connection

Non-persistent & Persistent Connection

- ▶ In Client-Server communication, Client making a series of requests to server, Server responding to each of the requests.
- ▶ Series of requests may be made back-to-back or periodically at regular time interval.
- ▶ So, Application developer need to make an important decision;
 - ➔ Should each request/response pair be sent over a separate TCP connection.
 - ➔ OR should all the requests and corresponding responses be sent over same TCP connection?

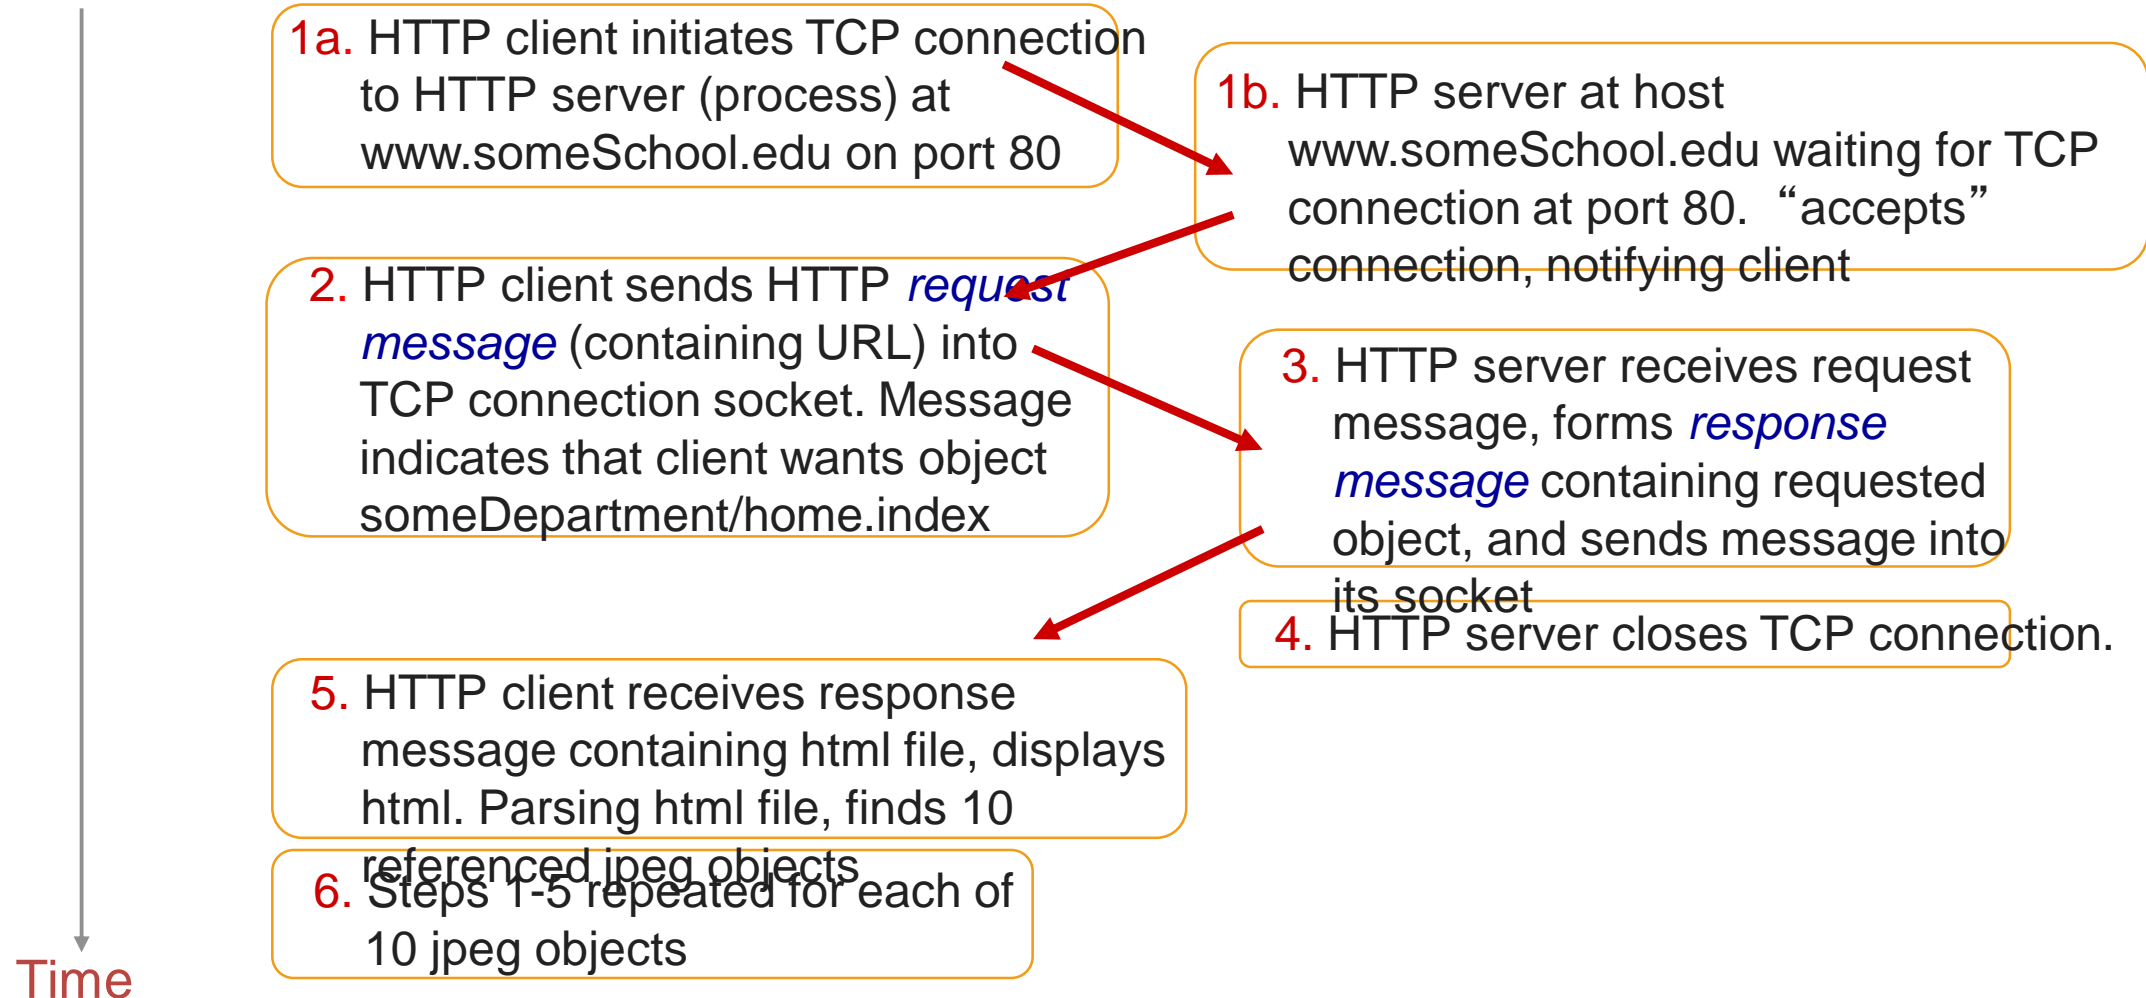

Non-persistent HTTP

- ▶ A non-persistent connection is **closed after the server sends the requested** object to the client.
- ▶ The connection is used exactly for **one request and one response**.
- ▶ For downloading multiple objects, it required multiple connections.
- ▶ Non-persistent connections are the default mode for **HTTP/1.0**.
- ▶ Example:
 - ➔ Transferring a webpage from server to client, webpage consists of a base HTML file and 10 JPEG images.
- ▶ Total 11 object are residing on server.

Non-persistent HTTP – Cont....

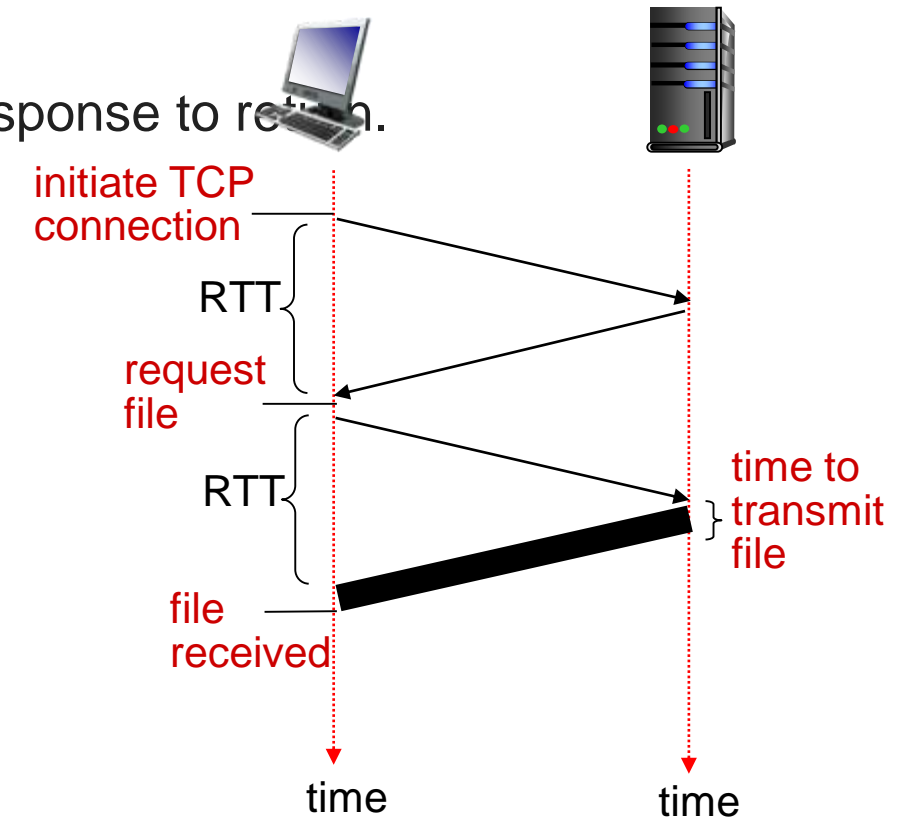

► URL `www.someSchool.edu/someDepartment/home.index`

Non-persistent HTTP: Response time

- ▶ RTT(**round-trip time**): A time for a small packet to travel from client to server and vice versa.
- ▶ HTTP response time:
 - ➔ One RTT to initiate TCP connection.
 - ➔ One RTT for HTTP request and first few bytes of HTTP response to return.
 - ➔ File transmission time

*Non-persistent HTTP response
time =
 $2RTT$
+
file transmission time*

Persistent HTTP

- ▶ Server **leaves the TCP connection** open after sending responses.
- ▶ Subsequent HTTP messages between same client and server sent over **open connection**.
- ▶ The server closes the connection only when it is not used for a certain configurable amount of time.
- ▶ It requires as little as one round-trip time (RTT) for all the referenced objects.
- ▶ With persistent connections, the performance is improved by 20%.
- ▶ Persistent connections are the default mode **for HTTP/1.1**.

HTTP Message Format

► Two types:

1. Request Message
2. Response Message

HTTP Request Message

- ▶ It is in ASCII format which means that human-readable format.
- ▶ HTTP request message consist three part:
 - Request line
 - Header line
 - Carriage return

The diagram shows an example of an HTTP request message with annotations. The message is displayed in a light orange box. Blue arrows point from text labels to specific parts of the message:

- request line (GET, POST, HEAD commands)**: Points to the first line of the message: `GET /index.html HTTP/1.1\r\n`.
- header lines**: A bracket on the left side of the box groups the lines from `Host:` to `Connection:`.
- carriage return (line feed at start of line indicates end of header lines)**: Points to the `\r\n` sequence at the end of the `Connection: keep-alive` line.
- carriage return character**: Points to the `\r` character in the `\r\n` sequence at the end of the first line.
- line-feed character**: Points to the `\n` character in the `\r\n` sequence at the end of the first line.

```
GET /index.html HTTP/1.1\r\nHost: www-net.cs.umass.edu\r\nUser-Agent: Firefox/3.6.10\r\nAccept: text/html,application/xhtml+xml\r\nAccept-Language: en-us,en;q=0.5\r\nAccept-Encoding: gzip,deflate\r\nAccept-Charset: ISO-8859-1,utf-8;q=0.7\r\nKeep-Alive: 115\r\nConnection: keep-alive\r\n\r\n
```

HTTP Request Message - Format

- ▶ The request line has three fields: **Method** field, **URL** field, and **HTTP version** field.
- ▶ The method field can take on several different values, including GET, POST, HEAD, PUT, and DELETE.
- ▶ In above message, browser is requesting the object /somedir/page.html and version is self-explanatory; browser implements version HTTP/1.1.
- ▶ The header line Host: www-net.cs.umass.edu specifies the host on which the object resides.
- ▶ User agent indicate browser name and version.

HTTP Response Message

► HTTP response message consist of three part:

1. Status line
2. Header line
3. Data (Entity body)

status line
(protocol
status code
status
phrase)

header
lines

data, e.g.,
requested
HTML file

```
HTTP/1.1 200 OK\r\n
Date: Sun, 26 Sep 2010 20:09:20 GMT\r\n
Server: Apache/2.0.52 (CentOS)\r\n
Last-Modified: Tue, 30 Oct 2007 17:00:02
      GMT\r\n
ETag: "17dc6-a5c-bf716880"\r\n
Accept-Ranges: bytes\r\n
Content-Length: 2652\r\n
Keep-Alive: timeout=10, max=100\r\n
Connection: Keep-Alive\r\n
Content-Type: text/html; charset=ISO-8859-
      1\r\n
\r\n
data data data data data ...
```

HTTP Response Message - Format

- ▶ The status line has three fields: **protocol version** field, **status code** and **corresponding status message**.
- ▶ In below example, the status line indicates that the server is using HTTP/1.1 and that everything is OK.

```
HTTP/1.1 200 OK\r\n
Date: Sun, 26 Sep 2010 20:09:20 GMT\r\n
Server: Apache/2.0.52 (CentOS)\r\n
Last-Modified: Tue, 30 Oct 2007 17:00:02 GMT\r\n
ETag: "17dc6-a5c-bf716880"\r\n
Accept-Ranges: bytes\r\n
Content-Length: 2652\r\n
Keep-Alive: timeout=10, max=100\r\n
Connection: Keep-Alive\r\n
Content-Type: text/html; charset=ISO-8859-1\r\n \r\n
data data data data data ...
```

Content-Type: header line indicates that the object in the entity body is HTML text.

Content-Length: header line indicates the number of bytes in the object being sent.

Last-Modified: header line indicates the time and date when the object was created or last modified.

Server: header line indicates that the message was generated by an Apache Web server.

Date: header line indicates the time and date when the HTTP response was created and sent by the server.

HTTP Response Status Codes

- ▶ A status code appears in 1st line in server-to-client response message.
- ▶ Some sample codes:
 - 200 OK
 - Request succeeded, requested object later in this message
 - 301 Moved Permanently
 - Requested object moved, new location specified later in this message(Location)
 - 400 Bad Request
 - Request message not understood by server
 - 404 Not Found
 - Requested document not found on this server
 - 505 HTTP Version Not Supported
 - Requested http version not support

Outline - Summary

- ▶ Principles of Computer Applications
 - ↳ Browser, Web Server, Email, P2P Applications etc...
- ▶ Application Layer (TCP – UDP Services)
- ▶ Web (Web Pages – Objects like html, jpeg, mp3, etc...)
- ▶ HTTP (TCP connection, port-80, persistent & non-persistent conn.), Request & Response Message format, Cookies, Web caches, FTP, Port-21
- ▶ E-mail (User agent, Mail Server, SMTP port - 25), POP3, IMAP
- ▶ DNS (Domain names to IP Address), hierarchy structure
- ▶ Socket programming with TCP and UDP (TCP – Sock_Stream, UDP – Sock_DGram)
